

Decarbonising Care

Preventative (low carbon!) care is the best sort – it makes people healthier and reduces carbon emissions at the same time

Did you know...

- Improving energy efficiency and warmth at home can significantly improve blood pressure, reduce hospital admissions for respiratory and cardiovascular disease, and cut CO₂ emissions.
- As well as reducing risk of strokes and heart attacks, exercise is also an effective treatment for depression. Less driving also means cleaner air, fewer accidents, less obesity – and less CO₂.
- People who eat less red meat don't just reduce their carbon footprint, they lower their risk of bowel cancer and vascular disease at the same time.

Why not...

- Screen your patients for cold homes, and referring them to local housing services? (check what's on offer in your area, and have a look at www.est.org.uk) Could you make this part of the routine for admission or discharge?
- Encourage your patients to walk, cycle and generally get active? Let them know how it could benefit their condition. Maybe you could refer them to a Green Gym? www2.btcv.org.uk/display/greengym
- Talk to patients about how they could reduce their meat intake? Speak to your dieticians about vegetarian recipes to recommend.
